(Rudd, Goulding, & Bryan, 2011)
The problem of military suicide...
What we know and don’t know about treating suicidal behavior
Why don’t we know more about which treatments work for reducing suicidality?
1. Poorly-defined constructs

Suicide attempt?  Nonsuicidal self-injury?

Suicidal ideation?  Morbid ideation?

“Suicidality”?
2. Approximately 45% of treatment efficacy trials exclude high risk patients
3. Limited follow-up periods
4. Variable nature of the construct makes it hard to measure
What do we know about what works for suicide risk?
53 psychosocial clinical trials targeting suicidality

- “Clinical trial” = study including both treatment and control (or comparison) condition
- Randomization not required
- 28 (53%) were cognitive-behavioral
- Only one RCT has utilized military personnel (Rudd et al., 1996)
What works

1. Theoretical models easily translated to clinical work
   - Well-defined and theoretical models embedded in empirical research
   - Identify thoughts, emotional processing, and associated behavior responses
   - Patients can easily understand why they have tried or are thinking about suicide
What works

2. Treatment fidelity

- Clinician training to competence with supervision
- Manual-driven
- Clear sequence or hierarchy of treatment targets
- Suicidal behaviors is central treatment focus independent of psychiatric condition
What works

3. Adherence

- Specific interventions and techniques to target poor adherence and motivation
- Clear directions about what to do if nonadherence emerges
What works

4. Emphasis on skills-building
   – Identification of skills deficits with opportunity for skills building and practice
   – Clear understanding of “what is wrong” and “what to do about it”
What works

5. Personal responsibility

– Emphasis on patient self-reliance and self-management

– Patients assume high level of responsibility for their care, including crisis management
What works

6. Easy access to treatment and crisis services
   - Clear plan of action for emergencies
   - Dedication of time to practicing skills necessary to identify true crisis, using crisis plan, and using external support services judiciously
What works

1. Theoretical models easily translated to clinical work
2. Treatment fidelity
3. Adherence
4. Emphasis on skills-building
5. Personal responsibility
6. Easy access to treatment and crisis services
Foundations for care
Why adopt a standardized language of suicide?

1. Remove pejorative language
2. Improves consistency of documentation
3. Improves communication between clinicians
4. Improves accuracy of risk assessments
5. Improves clinical decision-making
6. Improves treatment outcomes
3 important definitional criteria

1. Intent
2. Evidence of self-infliction
3. Outcome

(Maris et al, 1992)
Suicide-Related Terms

Suicide attempt

Intentional, self-enacted, potentially injurious behavior with any (nonzero) amount of intent to die, with or without injury

Nonsuicidal self-injury

Intentional, self-enacted, potentially injurious behavior with no (zero) intent to die, with or without injury

Suicidal ideation

Thoughts of ending one’s life or enacting one’s death

Nonsuicidal morbid ideation

Thoughts about one’s death without suicidal or self-enacted injurious content
Common reactions to suicidal patients

Fear → Helplessness
      → Hopelessness

Anxiety → Over-protectiveness
      → Under-protectiveness

Anger → Lack of compassion
      → Criticism
Emotion reactions lead to mistakes

- **Over-react** and perhaps impose unnecessary external controls or reactions

- **Under-react** and perhaps deny the need for protective measures

- **Reject** or abandon the patient
Clinician vs. patient goals

Clinician: prevent death, don’t get sued

Patient: alleviate suffering
Resolving the conflict

1. Understand that the patient engages in harmful behaviors because they “make sense” and they work

2. Recognize the functional purpose of the behaviors

3. View the patient as individual with unique set of issues and circumstances

4. Listen to the patient’s “story”
Functional model of suicide

Reinforcement

<table>
<thead>
<tr>
<th>Positive</th>
<th>Negative</th>
</tr>

(Bryan & Rudd, 2012; Nock & Prinstein, 2004)
Negative reinforcement

Failed attempts to suppress/control thoughts

Preparing

(Brown, 1998; Najmi, Wegner, & Nock, 2007)
Fluid vulnerability theory
“I got my second Article 15. I’ll probably lose a stripe over it, and they’re going to send me back home now. I told my girlfriend about it and she got mad at me and hung up the phone. She won’t answer my phone calls or emails now. I just don’t know what I’m going to do. I was in my room yesterday and I was just thinking to myself “What’s the point? I just fuck everything up.” So I took out my gun from my holster and loaded it, and held it to my head. I started to pull the trigger, but then my friend came to my door and knocked. She saw me with the gun and asked what I was doing and I told her. She took my gun away and went and told the Shirt, and they took me to mental health. If my friend hadn’t come right then I’m pretty certain I’d be dead. It just happened so fast.”
Fluid vulnerability theory

Fundamental Assumptions:

- Baseline risk varies from individual to individual
- Baseline risk is determined by *static* factors
- Baseline risk is higher and endures longer for multiple attempters (2 or more attempts)
- Risk is elevated by aggravating factors
- Severity of risk is dependent on baseline level and severity of aggravating factors

(Rudd, 2006)
Fluid vulnerability theory

Fundamental Assumptions (cont’d):

- Risk is elevated by aggravating factors for limited periods of time (hours, days, weeks), and resolves when risk factors are effectively targeted
- Risk returns to baseline level only
- Risk is reduced by protective factors
- Multiple attempters have fewer available protective factors (support, interpersonal resources, coping/problem-solving skills, etc.)

(Rudd, 2006)
Predispositions
Prior suicide attempts
Abuse history
Impulsivity
Genetic vulnerabilities

Behavior
Substance abuse
Social withdrawal
Nonsuicidal self-injury
Rehearsal behaviors

Cognition
“I’m a terrible person.”
“I’m a burden on others.”
“I can never be forgiven.”
“I can’t take this anymore.”
“Things will never get better.”

*DBT indicates dialectical behavior therapy; IQR, inner quartile range.
†P<.01, one-tailed test.
‡P<.05, one-tailed test.
§For year total, data to end point were used for subjects who were not in study at the 8- to 12-month period.

Fig 1.—Percentage of subjects with parasuicide, by condition. Months 0 to 4 indicated significant difference between subjects (triangles) who received dialectical behavior therapy and control subjects (squares) (z = 2.7, P < .05); months 8 to 12, significant difference between subjects who received dialectical behavior therapy and control subjects (z = 1.74, P < .05).

Linehan et al. (1991). Arch Gen Psychiatry, 48, 1060-1064
Dialectical behavior therapy

Fig 2.—Percentage of subjects in individual psychotherapy, for those subjects beginning with a new therapist at pretreatment, by condition. Months 4 to 8 indicate significant difference between subjects who received dialectical behavior therapy (triangles) and control subjects (squares) \( z = 1.63, P < 0.05 \); months 8 to 12, significant difference between subjects who received dialectical behavior therapy and control subjects \( z = 2.11, P < 0.01 \). Note that two subjects who were assigned to dialectical behavior therapy and who were out of therapy also stopped assessments. It is possible that they entered some other individual therapy. To be conservative, they are counted as not in individual therapy.

Fig 3.—Median psychiatric days for hospitalized subjects, by condition. Months 0 to 4 indicate significant difference between subjects who received dialectical behavior therapy (shaded bars) and control subjects (open bars) \( z = 2.54, P < 0.05 \); months 8 to 12, trend between subjects who received dialectical behavior therapy and control subjects \( z = 1.49, P < 0.10 \); and year, significant difference between subjects who received dialectical behavior therapy and control subjects \( z = 1.70, P < 0.05 \). The number of hospitalized subjects who received dialectical behavior therapy were as follows: 0 to 4 months \( n = 6 \), 4 to 8 months \( n = 5 \), 8 to 12 months \( n = 3 \), and year \( n = 8 \). The number of hospitalized control subjects were as follows: 0 to 4 months \( n = 9 \), 4 to 8 months \( n = 7 \), 8 to 12 months \( n = 7 \), and year \( n = 12 \).

Kenneth Delano, PhD (Collaborator)

Army Warrior Resiliency Program
COL Bruce Crow, PsyD (Consultant)
MAJ Monty Baker, PhD (Consultant)
Phase I:
Crisis management, distress tolerance

Phase II:
Cognitive restructuring of suicidal belief system, problem solving, cognitive flexibility

Phase III:
Relapse prevention
How BCBT differs from TAU

**TAU (n = 75)**
- Suicide as symptom of psychiatric dx
- Focus on psych dx
- Emphasizes external sources of self-mgt, including hospitalization
- Clinician responsibility for preventing suicide

**BCBT (n = 75)**
- Suicide as problem distinct from psych dx
- Focus on suicide risk
- Emphasizes internal sources of self-mgt to minimize hospitalization
- Shared patient-clinician responsibility for preventing suicide
Competency-based progress

- Progress through treatment is determined based on patient skill mastery
- Patient must demonstrate skill mastery for each phase before progressing to next phase
- If patient demonstrates insufficient skills mastery at later phase, clinician returns to earlier phase
- Final competency check is relapse prevention task

(Bryan et al., 2011)
Phase I: Emotion Regulation
Primary tasks

1. Describe treatment
2. Conduct assessment of index suicidal episode
3. Educate patient about suicidal mode
4. Develop crisis response plan
5. Develop treatment plan & obtain commitment
6. Emotion regulation skills training
Session 1

Describing the treatment

- Cognitive behavioral session structure (mood checks, agenda setting, homework, skills training)
- 3 phases of treatment
- Confidentiality
- Role of family members and/or supportive others

Session structure facilitates emotion regulation for patients
Session 1

Index suicidal episode assessment

– Ask patient to describe the chronology of events for the suicidal episode that led up to treatment
  • “Let’s talk about the day you attempted suicide. Can you tell me what happened on that day?”
– Assess events, thoughts, emotions, physical sensations, and behaviors in order
  • “What happened next?” / “And then what happened?”
– Remain focused on the index suicidal episode
### Table 4. Factors Associated With an Increased Risk for Suicide

<table>
<thead>
<tr>

<td>Loss of executive function&lt;sup&gt;a&lt;/sup&gt;</td>
</tr>
<tr>
<td>Family history of mental illness, including substance use disorders</td>
<td>Thought constriction (tunnel vision)</td>
</tr>
</tbody>
</table>

### Physical illnesses

- Diseases of the nervous system
- Multiple sclerosis
- Huntington’s disease
- Brain and spinal cord injury
- Seizure disorders
- Malignant neoplasms
- HIV/AIDS
- Peptic ulcer disease
- Chronic obstructive pulmonary disease, especially in men
- Chronic hemodialysis-treated renal failure
- Systemic lupus erythematosus
- Pain syndromes
- Functional impairment

### Psychiatric diagnoses

- Major depressive disorder
- Bipolar disorder (primarily in depressive or mixed episodes)
- Schizophrenia
- Anorexia nervosa
- Alcohol use disorder
- Other substance use disorders
- Cluster B personality disorders (particularly borderline personality disorder)
- Comorbidity of axis I and/or axis II disorders
Proximal vs. distal risk factors
Previous suicide attempts

- Emphasis on intent:
  - “What did you hope would happen?”
  - “Did you want to die?”
  - “Were you happy to be alive, or did you wish you were dead afterwards?”

- Establish patterns: first, worst, most recent

- “Worst-point” suicidal episode (Joiner, Steer, Brown, Beck, Pettit, & Rudd, 2003)
Precipitant / triggering event
- Almost always some sort of perceived loss

Symptomatic presentation
- Depressed mood
- Hopelessness
- Perceived burdensomeness
- Thwarted belongingness
- Agitation
- Insomnia
Nature of suicidal thinking
– Resolved plans & preparation
– Suicidal desire & ideation

**RPP**
- Sense of courage
- Availability of means
- Opportunity
- Specificity of plan
- Duration of suicidal ideation
- Intensity of suicidal ideation

**SDI**
- Reasons for living
- Wish for death
- Frequency of ideation
- Desire and expectancy
- Lack of deterrents
- Suicidal communication
Nature of suicidal thinking
– Suicidal intent: subjective vs. objective

**Objective**
- Isolation
- Likelihood of intervention
- Preparation for attempt
- Planning
- Writing a suicide note

**Subjective**
- Self-report of desired outcome
- Expectation of outcome
- Wish for death
- Low desire for life
**Intent**
- **Objective**
  - Sense of courage
  - Likelihood of intervention
  - Preparation for attack
  - Specificity of plan
  - Duration of suicidal ideation
  - Intensity of suicidal ideation

- **Subjective**
  - Sense of purpose in life
  - Expectation of death
  - Wish for death
  - Desire to be alive
  - Lack of deterrents
  - Suicidal communication

**Ideenation**
- **Objective**
  - Sense of courage
  - Likelihood of intervention
  - Preparation for attack
  - Specificity of plan
  - Duration of suicidal ideation
  - Intensity of suicidal ideation

- **Subjective**
  - Sense of purpose in life
  - Expectation of death
  - Wish for death
  - Desire to be alive
  - Lack of deterrents
  - Suicidal communication
**Predispositions**
- Prior suicide attempts
- Abuse history
- Impulsivity
- Genetic vulnerabilities

**Behavior**
- Substance abuse
- Social withdrawal
- Nonsuicidal self-injury
- Rehearsal behaviors

**Cognition**
- “I’m a terrible person.”
- “I’m a burden on others.”
- “I can never be forgiven.”
- “I can’t take this anymore.”
- “Things will never get better.”

**Emotion**
- Shame
- Guilt
- Anger
- Anxiety
- Depression

**Physiology**
- Agitation
- Sleep disturbance
- Concentration problems
- Physical pain

**Trigger**
- Job loss
- Relationship problem
- Financial stress

**Suicidal Mode**
Session 1

Educate patient about suicidal mode

- Describe suicidal mode in understandable language
- Diagram suicidal mode for patient and “fill in” based on information obtained from patient
- Direct patient to draw mode in treatment log
Session 1

Treatment log

– Provide treatment log to patient
– Explain rationale:
  • Understanding patterns in past events
  • Regulating emotions
  • Maintaining perspective of health
  • Relapse prevention
– Patients should record their “lessons learned” from each session in the log
Session 1

Crisis response plan

– Explain rationale for CRP
– Provide card for patient to record CRP
– Identify personal warning signs
– Identify self-management strategies
– Identify social supports
– Provide crisis / emergency steps
– Verbally review and rate likelihood of use
Other Phase I components

Means restriction counseling

- Ask every patient about access to lethal means
- Specifically ask every patient about firearms access
- Provide means restriction counseling
- Develop a written plan for means restriction
- Be cautious about engaging in power struggles with patients about access to means
  - Emphasize shared goal of pain reduction and suffering alleviation, not suicide prevention or means restriction

(Bryan, Stone, & Rudd, 2011)
Other Phase I components

Commitment to treatment statement

- Review in detail with patient – approach as discussion, not as lecture or “contract”
- Discuss how treatment is defined and what is expected of patients
- Allow patient to add their personal expectations of you as the clinician
- Keep copy, give original to the patient
Other Phase I components

Treatment plan

– Suicide risk should be #1 priority – couch in terms of suffering reduction and goal acquisition
– Prioritize symptom hierarchy to be targeted
– Create goals that are specific, measurable, and behavioral in nature
Remember that the primary goal of Phase I is emotional regulation, not cognitive restructuring.

Patients must first learn how to manage their suffering before they can change how they view themselves and others.
When teaching patients new skills, always be sure to explain the rationale for the skill, and explicitly tie it to the suicidal mode (i.e., suffering reduction).

Always practice skills in session to facilitate mastery, and assist patients in recognizing how skills serve to reduce suffering.
Emotion regulation strategies

- Relaxation training
- Mindfulness training
- Reasons for living list
- Survival kit
- Sleep hygiene / stimulus control
Reasons for living (RFL) list

- Provide patient with an index card
- Ask them to think about what is worth living for
- Ask follow-up questions to increase the emotional vividness and specificity of the memory
- Record the RFL onto the card
- Practice thinking about the RFL
- Ask patient to think about a stressful situation and then think about their RFL
Survival kit

- Direct patients to obtain a container (e.g., shoe box, envelope, tackle box)
- Patient should fill container with items that cue positive emotional states (e.g., quotes, pictures, souvenirs, gifts, etc.)
- Patient brings container into therapy and reviews each item with clinician
  - “Tell me about this item.”
  - Screen out potentially harmful or iatrogenic items
Sleep hygiene & stimulus control

- Educate patient about healthy sleep habits
- Identify sleep behaviors for potential modification
- Develop plan and commitment for changing sleep behaviors
- Provide sleep diaries to track progress
Phase II: Problem Solving & Cognitive Reappraisal
Primary tasks

1. Review and rehearse emotion regulation strategies in order to generalize across situations
2. Target core beliefs and behaviors that contribute to the suicidal mode
3. Undermine shame and guilt
4. Teach patients how to consider alternatives to learned behavioral and cognitive patterns
Phase II strategies

- ABC worksheets
- Challenging beliefs worksheets
- Behavioral activation
- Coping cards
ABC worksheet

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activating Event</td>
<td>Belief</td>
<td>Consequence</td>
</tr>
<tr>
<td>What is going on?</td>
<td>What do I say to myself?</td>
<td>What do I feel as a result?</td>
</tr>
<tr>
<td>What happened?</td>
<td>What goes through my mind?</td>
<td>What emotion do I feel?</td>
</tr>
</tbody>
</table>

Are the thoughts in “B” reasonable? Why or why not?

_____________________________________________________

_____________________________________________________

What is something else I can tell myself in the future when I’m having these thoughts or am in this situation again?

_____________________________________________________

_____________________________________________________

_____________________________________________________
Challenging beliefs worksheet

1. What is the evidence for and against this belief?
   **FOR:**
   **AGAINST:**
2. Is this belief based on facts, or is it something you’ve just gotten used to saying?
3. Is it possible that you are misinterpreting or misunderstanding the situation?
4. Are you thinking in all-or-none terms?
5. Are you using words or phrases that are extreme or exaggerated (i.e., always, forever, never, need, should, must, can’t, and every time)?
6. Are you ignoring the bigger picture by focusing on only one aspect of what happened?
7. Is your belief based on a reliable source of information?
8. Are you confusing a low probability event with a high probability event?
9. Are your judgments based on feelings or on facts?
10. Are you focused on factors that don’t have much to do with the situation?
Behavioral Activation

- Identify enjoyable or meaningful activities
  - “Are there things you used to enjoy doing that you no longer do?”
- Develop a specific plan for resuming or increasing activities (location, date, time, with whom, etc.)
- Problem solve potential barriers
- Ask patient to rate likelihood of doing it
Coping cards

• Build off of previous cognitive and behavioral interventions
• Similar to crisis response plan
• Ask patient to record thought, behavior, or skill onto index card to cue rehearsal
• Card should be rehearsed regularly, even in situations not being targeted
Phase III: Relapse Prevention
Primary tasks

1. Conduct relapse prevention task repeatedly
2. Review index suicidal episode several times until patient demonstrates ability to problem solve
3. Develop hypothetical future crises and conduct imaginal exposure with patient imagining effective use of problem solving skills
Relapse prevention task

- Educate patient about relapse prevention task
- Answer questions and address concerns
- Instruct patient to remain in present tense
- Prompt patient during task to increase emotional vividness and specificity
- As patient demonstrates competency, increase complexity and difficulty of task
- Process task following completion
Final session

1. Review treatment log contents
2. Determine final “lesson learned” for treatment log
3. Educate patient on follow-up procedures as needed
4. Provide patient with token of treatment completion (e.g., coin, certificate, etc.)
Early observations

• Service members take numerous medications
• Providing patients with treatment log (or “smart book”) is a highly effective method for obtaining buy-in, skills training, and relapse prevention
• Framing treatment as occupational skills training
• Phase I must target emotion regulation
• Guilt/shame common themes & targets of Phase II
• BCBT appears to retain patients at a higher rate
• Combat exposure /trauma are distal contributors
