Suicide Prevention as a Core Priority in Healthcare: Zero Suicide and Suicide Safe Care

Richard McKeon Ph.D. SAMHSA
Behavioral Health is Essential To Health

Prevention Works

Treatment is Effective

People Recover
2012 National Strategy for Suicide Prevention: GOALS AND OBJECTIVES FOR ACTION

A report of the U.S. Surgeon General and of the National Action Alliance for Suicide Prevention
What Is Zero Suicide?

- Part of the National Strategy for Suicide Prevention
  - GOAL 8: Promote suicide prevention as a core component of health care services, to include promoting "zero suicides" (8.1), continuity of care (8.4), coordinating services (8.7), and developing collaboration (8.8).
  - GOAL 9: Promote and implement effective clinical and professional practices for assessing and treating those at risk for suicidal behaviors.
Why ZeroSuicide in Health Care?

We Need A Healthcare Focus on Suicide Prevention, and A Suicide Prevention Focus on Healthcare

_Until Now, We Have Neither_

Suicide Prevention Field

Health Care

An Urgent Burden in Crisis Care, ED’s, Inpatient Psych...But Not a Priority for Health Systems
What is Different in Zero Suicide?

A **Core** Healthcare Focus on Suicide Prevention, and
A Suicide Prevention Focus on Healthcare

Suicide Prevention

Health Care

- All Behavioral Healthcare Settings
- Integrated/Advanced Primary Care
- ACO’s, Integrated Systems
- Health Plans

Why Suicide Prevention in Health Care? 
*Risks and Solutions* are there

- Half of the people who die by suicide saw an MD in previous month
- South Carolina: 10% of all people who died by suicide had been in ED in previous 60 days
- Risks are great among people receiving mental health care:
  - Risk among people with depression and other mental health problems are 4-20x general population
  - Kentucky: 20% of all suicides in state among people who got any MH care (claims/deaths crosswalk)
  - NYS: 226 reported suicides in public MH system in 2012 (15% of estimated 1500 suicide deaths in NYS)
- But...solutions are emerging!
You can’t fix what you can’t measure.

Perhaps a third of all suicide decedents accessed care prior to death, but few U.S. health care systems track suicide outcomes.

Mental Health Research Network Report (within 12 months of suicide death)

- Contact with Health Care: 17%
- No Contact with Health Care: 83%

Of those with contact with health care, 45% had a psychiatric diagnosis.

Suicide Decedents from NVDRS States

- In mental health treatment at time of death: 31%
- Not in mental health treatment at time of death: 69%

Why Do We Need A Systematic, Clinical Approach?

There’s no “single path” suicide prevention solution that is adequate and many common approaches won’t reach most people at the greatest risk

• We have missed some lessons from our greatest suicide prevention success:
  
  • We have to reach everyone at risk: An identified (“boundaried”) population, and a way to reach them
    ▪ We have (new) solutions to keep intensely suicidal people alive, and help them heal. They involve excellent, suicide safe mental health care: a ZeroSuicide approach
What is Zero Suicide?

- A priority of the National Action Alliance on Suicide Prevention based on its Clinical Care Task Force
- A framework for systematic, clinical suicide prevention in behavioral health and healthcare systems
- A focus on safety and error reduction in healthcare
- A set of best practices and tools for health systems and providers
- An aspirational goal that says we are determined to do all we can to keep all those in our care safe.
- An effort to combat fatalism and fear of blame for suicide deaths in our healthcare systems.

What is Zero Suicide?

“Over the decades, individual (mental health) clinicians have made heroic efforts to save lives... but systems of care have done very little.”
- Dr. Richard McKeon
SAMHSA

“Suicide represents a worst case failure in mental health care. We must work to make it a ‘never event’ in our programs and systems of care.”
- Dr. Mike Hogan
New York State Office of Mental Health
Zero Suicide/Suicide Safe Care

• Suicide prevention is too challenging to be accomplished without sustained, systematic effort. It must be a core priority and has definable dimensions. Expecting individual clinician’s to predict suicide and than blaming them is neither helpful nor sufficient.
• Don Berwick- Every system is perfectly designed to get the results its gets.
The Elements of ZeroSuicide in a Health Care Organization

Continuous Quality Improvement

Create a leadership-driven, safety-oriented culture

Pathway to Care
- Identify and assess risk
  - Screen
  - Assess
- Evidence-based care
  - Safety Plan
  - Restrict Lethal Means
  - Treat Suicidality and MI
- Continuous support as needed

Develop a competent, confident, and caring workforce

Electronic Health Record
Essential Dimensions of Suicide Care

• Leadership driven, safety oriented culture committed to dramatically reducing suicide among people under care and includes the voices of suicide loss survivors and those who have attempted suicide or experienced a suicidal crisis.

• Systematically identifying and assessing suicide risk levels among people at risk.
Essential Dimensions of Suicide Care

• Ensuring every person has a pathway to care that is both timely and adequate to meet their needs.
• Developing a competent, confident and caring workforce.
• Using evidenced based care including collaborative safety planning, reducing access to lethal means, and effective treatment of suicidality.
Essential Dimensions of Suicide Care

• Continuing contact and support, especially after acute care.
• Applying a data driven quality improvement approach to inform system changes that will lead to improved patient outcomes and better care for those at risk.
In a study of almost 900,000 veterans who received treatment for depression between 1999-2004, suicide rates were highest in the 12 weeks following inpatient discharge (Valenstein et al, 2008).

Researchers' conclusions: “To have the greatest impact on suicide, health systems should prioritize prevention efforts following psychiatric hospitalizations.”

Improving post-discharge care transitions is central to the National Strategy for Suicide Prevention.
MISSED OPPORTUNITIES = LIVES LOST

- About 50% of suicide attempters fail to attend treatment post-discharge (Tondo et al, 2006).
- Only 52% of adult Medicaid recipients seen in EDs for a suicide attempt received outpatient follow up within 30 days (Olfson et al, 2011)
The WHO Multisite Intervention Study on Suicidal Behaviors

- Fleischmann et al (2008)
  - Randomized controlled trial; 1,867 suicide attempt survivors from five countries (all outside US)
  - Brief (1 hour) intervention as close to attempt as possible
  - 9 F/u contacts (phone calls or visits) over 18 months

Results at 18 Month F/U

- Died of Any Cause
  - Usual Care: 2.5%
  - Brief Intervention: 1.3%

- Died by Suicide
  - Usual Care: 0.5%
  - Brief Intervention: 0.3%

Legend:
- Red: Usual Care
- Blue: Brief Intervention
International Efforts

• England—Reduction in suicides in communities that implemented recommendations
• Largest reductions in when 24 hr community crisis care, proactive outreach available
• Follow-up within 7 days of IPU discharge
• Taiwan—Follow-up after suicide attempts led to 63% reduction in suicides.

**SMI Suicide Rate vs. General Population**

- Over 6,000 report a patient has died by suicide (27%).
  - Once: 3,314 / 15%
  - More than once: 2,792 / 13%

**Endorsed Don’t Know, Disagree, or Completely Disagree**

- Skills: 39%
- Training: 44%
- Supports: 30%
- One/Three: 53%
High Reliability – Aviation goal zero commercial crashes
- Don’t train only the pilots; instead, all procedures & systems target success

Health Systems – Eliminate:
- Wrong-site, patient surgery
- Inpatient falls
- Medication errors

Crossing the Quality Chasm
I. Core Values & Beliefs

- Current science: Suicide is preventable
  - Those who die by suicide have intense ambivalence
  - Caring saves lives

- Last decade:
  - Increased research on effective interventions
  - Development of standardized risk assessments & standards
  - Systems successes

II. Systems Management

III. Evidence Based Care

Result: Lives Saved
II. Systems Management

- Robust Performance Improvement
  - Workforce Development
  - Standardized Clinical Care
    - Screening & Assessment
    - Stratification of Risk
    - Regimen of Key Interventions
      - Access to Care
      - Means Restriction
      - Follow-up
  - Transparent Reporting & Feedback Loops, Commitment to Improvement
III. Evidence Based Clinical Care

- “Productive Interactions” – Therapeutic relationships based on engagement and collaboration
- Treat suicide risk directly (not just underlying diagnosis)
- Evidence based care
- Involuntary hospitalization is a last resort, considered a safety measure and possible sign of community care defects
Accountability for Results: Lives Saved

I. Core Values & Beliefs

II. Systems Management

- Timely public reporting of suicide deaths
  - Measure & Report
  - Feedback Loop

III. Evidence Based Care

Result: Lives Saved

Resources: “What is Zero Suicide?”

- Describes the history of the initiative
- Lists the seven core dimensions
- Explains where to get more information
Identifying and Assessing Suicide Risk Level

Screening for suicide risk should be a universal part of primary care, hospital and emergency department care, behavioral health care, and crisis response intervention. Any person who screens positive for possible suicide risk should be formally assessed for suicidal ideation, plans, means availability, presence of acute risk factors, history of suicide attempts, and level of risk.

**Screening**

**General Medical Settings**
The primary care setting is presents an excellent opportunity for suicide prevention. The Western Interstate Commission for Higher Education (WICHE), in partnership with the Suicide Prevention Resource Center (SPRC), offers a comprehensive toolkit for primary care practices.

Up to 76 percent of Americans who die by suicide had contact with their primary care provider in the month prior to their death.

Physicians and nurses may be concerned about asking patients about suicidal thoughts and behavior of without resources to help them respond to identified risk. It is essential that primary care practices and hospitals have access to behavioral health support for patients that have positive responses to suicide screens. Such support can be forged from local mental health providers or could be provided by telephone or online by crisis service organizations. State and local government health and mental health organizations can help provide the impetus for forging critical local relationships.

Recently, Medicare added procedure codes for a 15-minute screen for depression for Medicare patients. Such a screen could cover the first two questions below, and we recommend adding a third, direct question about suicide.

Zero Suicide Tool Kit
- About the Toolkit
- Zero Suicide Culture
- Pathway to Care
- Competent Workforce
- Suicide Risk Level
- Evidence-based Care
- Contact After Care

Work Force Readiness Survey

Zero Suicide Workforce Survey

Survey Overview. Our organization is making a commitment to improve our care for our clients who are at risk for suicide. The results of this survey will be used to help us determine the training needs of our staff and is part of an overall organizational mission to adopt a system-wide approach to caring for individuals at risk for suicide.

All responses are anonymous. Please answer items honestly so that we can best serve both our staff and our clients. Unless otherwise indicated, please mark only one answer. It is anticipated that this survey will take you between 10-15 minutes to complete.

We thank you in advance for taking this survey and for your dedication to this very important issue!

Understanding the prevalence of suicide.

1. The rate of suicide varies significantly from state to state, with rates in the mountain states nearly double that of those in the northeastern states.
   - True
   - False
   - Don't know

2. Youth ages 10-to 24 have a significantly greater risk of suicide than individuals ages 65 or older.
   - True
   - False
   - Don't know

3. The rate of suicide among those with severe mental illness is how many times that of the general population?
   - 1x
   - 2x
   - 3x
   - 4x
   - 6 to 12x

Safety Planning

Safety Planning Guide

A Quick Guide for Clinicians may be used in conjunction with the “Safety Plan Template”

Safety Plan FAQs?

WHAT IS A SAFETY PLAN?
A Safety Plan is a prioritized written list of coping strategies and sources of support patients can use who have been deemed to be at high risk for suicide. Patients can use these strategies before or during a suicidal crisis. The plan is brief, is in the patient’s own words, and is easy to read.

WHO SHOULD HAVE A SAFETY PLAN?
Any patient who has a suicidal crisis should have a comprehensive suicide risk assessment. Clinicians should then collaborate with the patient on developing a safety plan.

HOW SHOULD A SAFETY PLAN BE DONE?
Safety Planning is a clinical process. Listening to, empathizing with, and engaging the patient in the process can promote the development of the Safety Plan and the likelihood of its use.

IMPLEMENTING THE SAFETY PLAN
There are 6 Steps involved in the development of a Safety Plan.

Sample Safety Plan

Step 1: Warning signs (thoughts, images, mood, situation, behavior that a crisis may be developing:

1. 
2. 
3. 

Step 2: Internal coping strategies – Things I can do to take my mind off my problems without contacting another person (relaxation techniques, physical activity):

1. 
2. 
3. 

Step 3: People and social settings that provide distraction:

1. Name _ Phone_ 
2. Name _ Phone_ 
3. Name _ Phone_ 

Step 4: People whom I can ask for help:

1. Name _ Phone_ 
2. Name _ Phone_ 
3. Name _ Phone_ 

Step 5: Professionals or agencies I can contact during a crisis:

1. Clinician Name _ Phone_ 
2. Clinician Name _ Phone_ 
3. Clinician Name _ Phone_ 

4. Local Urgent Care Services: Address _ Phone_ 
5. Suicide Prevention Lifeline Phone: 1-800-273-TALK (8225)

Step 6: Making the environment safe:

The one thing that is most important to me and worth living for is:

• Gives professional care providers tips to enhance emergency department treatment for people who have attempted suicide

• Discusses the assessment, communicating with family and with other treatment providers, and HIPAA

• Versions available for medical providers, patients, and family members

http://store.samhsa.gov/product/SMA08-4359
“There are those who say that the human body is much more complicated than our airplanes. There are those that counsel patience and say that these patient safety issues are complicated and they simply take time to fix.

But I take a different approach. I wish we were less patient. Every day, when each of us goes to work…we are choosing individually and collectively how many lives are going to be lost…

And the harm is so great, the numbers are so huge, that I don’t think we should wait 20 more years until there are 4 million more preventable medical deaths. We should change the way we do business now. It’s not going to be easy, but it is possible.”
